

Steady Eddie

The Steady Eddie is installed on the latch body to prevent misalignment or movement with the lock retractor. It is a quick and easy way to prevent the lock mechanism from binding or locking out.

The Steady Eddie has two widths: Long side for a regular 18-gauge steel door, short side for a steel door with a 16-gauge liner.

Instructions

1. Install the latch into a steel door.
2. Slip the Steady Eddie over the latch body and press into place between the door sheets.
3. Install the lock body.

NOTE:

- ♦ The **White** Steady Eddie is designed to accommodate a **grade one** heavy-duty latch.
- ♦ The **Blue** Steady Eddie is designed to accommodate the **grade two** light-duty latch.
